

A screenshot of a web browser displaying a discussion on the topic "Ethical vs Legal Boundaries Debate". The browser's address bar shows the URL "padlet.com/ezhilgracejohn/ethical-vs-legal-boundaries-debate-3xyf/hozxg61shl". The page features a green background with a grid of comment cards. Each card includes a user profile picture, name, and timestamp. The comments are as follows: 1. Haashini P (1 hour ago): "Yes we have to provide rewards to the ethical hackers because for the goodness of the organization in order to prevent it they are using the ethical hackers for analyzing the company data and prevention of any problem so yes they need to be awarded Haashini 192524047 (Team 2)". 2. Daybreak Greeter (1 hour ago): "No—ethical hackers should not test an organization's security without prior permission--Attempting to exploit or test a vulnerability without permission can violate cybercrime laws(Team 1)". 3. Daybreak Greeter (34 minutes ago): "Ethical hacking is not about breaking into systems to cause damage; it's about breaking into them legally and responsibly to find weaknesses before cybercriminals do. Ethical hackers are the digital guardians of our world, protecting businesses, hospitals, governments, and even our personal information. (Team 3)". 4. shaikdastagiri basha (19 minutes ago): "Our team strongly agrees that software companies should be held legally responsible for vulnerabilities in their products. Today, millions of people trust software for banking, education, healthcare, and communication. When companies release software with serious security flaws or ignore known vulnerabilities, users can lose their money, personal data, and privacy. We are not saying companies should be punished for every small bug. But when a company is careless, ignores security, or fails to fix known problems, it should be held accountable. With great technology comes great responsibility. If companies profit from their software, they must also take responsibility for keeping it secure. 192365056(Team 4)". 5. GOVARDHAN N (7 minutes ago): "User Privacy is more important in cybersecurity because it protects the personal information and fundamental rights of every individual. People use the internet for banking, communication, education, and shopping, so their personal data must remain safe and confidential. When user privacy is protected, people trust digital platforms and use online services with confidence. Although national security is important, it should be maintained without unnecessarily violating the privacy of innocent citizens. A strong cybersecurity system should protect both the nation and the privacy of its people.(TEAM-5)". 6. GOVARDHAN N (45 minutes ago): "Agree. Ethical hackers should be rewarded because they help". 7. K.Bhavya (1 hour ago): "Yes..I totally agree with it..Imagine a person entering your house without your permission just to check if your doors are locked... Even if they want to help, it is still considered trespassing right?!!..the same applies here.. 192324154-K.Bhavya". 8. DHARSHITHA K (1 hour ago): "I completely agree. Responsible". 9. Wave Voyager (6 minutes ago): "This is a strong and thoughtful". The browser's bottom status bar shows the time as 12:00 PM on 20-07-2026, along with various system icons and a search bar.

the argument could be stronger by acknowledging that rewards or bug bounties motivate ethical hackers to discover critical vulnerabilities beyond their routine work.

If we can see in other perspective,Relying on bounties makes companies lazy and risks data exposure during testing. We should invest in strong internal security first, not pay outsiders to fix what we missed...

Building on what Daybreak Greeter and Anjana mentioned, I agree that ethical hackers play a key role in finding vulnerabilities. But we also need to balance rewards so that the focus stays on security, not just money.

It is **ethical** because it **helps protect the company from cyberattacks and data breaches**. Monitoring work emails and internet usage can detect threats early and keep company information safe.(N.Govardhan Reddy(192411137)) TEAM-5

22 minutes ago

Privacy is important, but cybersecurity must come first. A single employee clicking a phishing link or downloading malicious software can compromise the entire organization's network. Therefore, reasonable and transparent monitoring is an ethical and necessary measure to prevent cyber threats and protect sensitive data.

To conclude, ethical hacking is essential for preventing cyberattacks and protecting data. However, it must always be done with proper authorization, ethics, and respect for privacy. Responsible ethical hacking creates a safer

responsible only when vulnerabilities result from negligence or failure to follow industry security practices. Not every bug is preventable, but ignoring known risks should have legal consequences.

"The statement presents a strong case for corporate accountability in cybersecurity. It effectively argues that while perfection isn't expected, ignoring known vulnerabilities is unacceptable when user safety and trust are involved."
(Mohamed aseem J 192511258)

GOVARDHAN N

11 minutes ago

Yes, legal responsibility increases accountability. When companies know they can face legal consequences, they are more likely to test their software carefully and fix vulnerabilities quickly.
(Thanigaivel-192565006)

Wave Voyager

"This is a well-reasoned perspective that clearly connects technological power with ethical responsibility. It effectively argues that companies must be accountable not just for innovation, but also for ensuring the safety and security of their users."
(Harshith G 192525394)

VARUN TEJ ARIGONDA

the importance of privacy without ignoring national security. It clearly shows that a strong cybersecurity system must protect both individual rights and the nation effectively.

Publishing...

To conclude, user privacy is more important because it protects people's personal information, builds trust in digital services, and safeguards individual rights. National security is important, but it should be achieved without compromising the privacy of innocent users. Therefore, cybersecurity should always prioritize user privacy while maintaining national safety.
